The City of North Las Vegas believes it is essential that our customers know all the facts about Southern Nevada’s drinking water. This report, which is issued each year, includes test results, a source water analysis, an overview of the treatment process and other valuable information relating to the quality of our municipal water supply.

If you have any questions or concerns relating to this report, please call us at 633-1561, Monday through Thursday, 7:00 am to 5:00 pm.

**MONITORED SUBSTANCES**

**Source Information**

Drinking water, including bottled water, may reasonably contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline at (800) 426-4791.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff and industrial or domestic wastewater discharges.
- Pesticides and herbicides, which may come from a variety of sources such as urban stormwater runoff and residential use.
- Organic chemical contaminants, including synthetic or volatile organic chemicals which are by-products of industrial processes and can come from gas stations, urban stormwater runoff and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of industrial activities.

In order to ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health. For more information on bottled water, call the International Bottled Water Association at 1-800-WATER11.

**Additional Monitored Substances**

These are additional substances which are monitored regularly. Although the EPA has not established MCLs for these substances, we believe it is important for our customers to know about anything that may affect their drinking water.

**Perchlorate** - A man-made salt consisting of chloride and oxygen, has been detected at low levels in untreated and treated water. Scientists have traced the small to shallow groundwater entering the Las Vegas Wash. Although there are no State of Nevada or federal limits for perchlorate in drinking water, Southern...
CNLV SOURCE WATER

Inflows to Lake Mead

Most of our drinking water comes from Lake Mead. Of that water, about 97 percent is from the Colorado River, which is one of the nation’s highest quality sources of drinking water. The Las Vegas Wash, which carries flood water and treated wastewater, accounts for only 1.45 percent of all the water in Lake Mead. Groundwater is also blended with treated water from the lake to meet customer demands.

**Source:** Lake Mead

**Inflows:**
- Colorado River (97.08%)
- Las Vegas Wash (1.45%)
- Virgin River (1.37%)
- Muddy River (0.10%)

**Potential Sources of Contamination:**
- Urban activities (fertilizers, pesticides, etc.)
- Industrial activities
- Wildlife activities

**Source:** Las Vegas Ground Water Aquifer

**Inflows:**
- Spring Mountain recharge,
- Sheep Range recharge,
- Artificial recharge
- (treated Lake Mead water)

**Potential Sources of Contamination:**
- Landfills, Domestic septic systems, Gas Stations (leaking underground storage tanks)

SHOPTING FOR A WATER FILTER?

**Ask The Authority**

As a public service, the Southern Nevada Water Authority (the regional agency responsible for treating and delivering the valley’s water) will provide consumers with information free of charge on various types of home water treatment systems. For an informational packet that can help you, make an informed choice, call 250-3936 or visit srwa.com for details.

MONITORED SUBSTANCES

Nevada’s water agencies are closely monitoring efforts by the Nevada Division of Environmental Protection to intercept and remove perchlorate at its source.

**Cryptosporidium** - This microscopically small organism is found in 95 percent of all surface water bodies in the United States. Laboratory staff test for Cryptosporidium in both the raw and treated water. While it is occasionally detected in untreated lake water, it has not been detected in the finished drinking water.

**MTBE** - Methyl tertiary butyl ether (MTBE), a chemical agent used to reduce smog, was not detected

**Chromium 6** - Chromium is a common element found in nature. It is made up of two forms, Chromium-3 and Chromium-6. In the Chromium-3 state, it is an essential nutrient with 50-200 micrograms per day recommended for adults. In the Chromium-6 state, however, it is believed to be a health risk from inhalation. It is not believed to be a threat to health from ingestion. While time to time, Chromium has been detected in Southern Nevada supplies, it has been less than one-tenth of the USEPA MCL of 100 ppb.

In response to public concern over Chromium-6 contamination in California, we have had our water supply tested for this element and it was undetected. We will continue to monitor for this contaminant on a monthly basis throughout 2002.
TESTING
Every month, scientists collect and analyze hundreds of water samples from throughout the valley. In fact, water treatment facility technicians test even more frequently and extensively than the Safe Drinking Water Act requires.

ON THE HORIZON
The current chlorination disinfection process is being converted to ozonation, a highly effective disinfection technology that infuses water with ozone. This advanced disinfection technique eradicates organisms such asCryptosporidium while reducing the amount of chlorine used in treatment. The Alfred Merritt Smith Water Treatment Facility will convert from chlorine to ozone as a primary disinfectant by 2002. The new River Mountain Water Treatment Facility will also utilize ozonation when it becomes operational that same year.

ADDITIONAL HEALTH INFORMATION
Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800) 426-4791.
**ANSWERS TO COMMON QUESTIONS**

**Q:** What's that taste in the tap water?

**A:** When you "taste" tap water, what you're probably tasting is the chlorine. Our tap water also contains naturally occurring calcium and magnesium which may contribute to the water's taste. These two harmless minerals, by the way, are what cause "cloudy" ice.

**Q:** Can you make the water taste better?

**A:** Yes. The technology exists to make tap water taste better. Unfortunately, that treatment comes at a high price, considering that less than one percent of all water used in Southern Nevada homes is actually consumed. Keeping in mind that tap water meets all federal water quality standards, the public may not want to absorb the cost of additional treatment. That said, ozonation may improve the taste of tap water because less chlorine will be required for disinfection. In the interim, refrigerating tap water overnight in a glass pitcher or adding a slice of lemon should improve the water's flavor.

**Q:** Why does tap water leave a residue on my kitchen and bathroom fixtures?

**A:** Ninety-seven percent (97%) of Lake Mead's water comes from the mountains via the Colorado River. Along the way, it dissolves harmless minerals from the river banks—particularly calcium and magnesium. These minerals remain dissolved in the water all the way to your tap. When the water irritably evaporates, it leaves the minerals behind.

The average hardness of the water in North Las Vegas is approximately 290 ppm (17 grains per gallon). Water is considered "hard" if the hardness is 100 ppm (5.84 grains per gallon) or more and is considered "soft" if the hardness is less than 100 ppm (5.84 grains per gallon).

**Q:** Do water treatment devices really work?

**A:** There are a wide variety of water treatment systems and filters available to consumers. Most of these will affect the aesthetic qualities of tap water. Advertisers' claims about safety concerns, however, are not as clear. Purchasing a home water treatment system is strictly a personal decision which should be based solely on preference.

For information on finding and purchasing the proper water filter see page 2 of this publication.

**WATER SAVER - HOME GUIDE**

### Usage Information

Outdoor water usage accounts for about 60 percent of the average residential bill except in hot summer months, when it can be as high as 90 percent. Here are some examples:

<table>
<thead>
<tr>
<th>ACTIVITY</th>
<th>USAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Running sprinklers for 15 minutes</td>
<td>200 gallons (depending upon type of sprinkler)</td>
</tr>
<tr>
<td>Watering with a hose</td>
<td>10 - 12 gallons per minute</td>
</tr>
<tr>
<td>Washing a car</td>
<td>100 gallons</td>
</tr>
<tr>
<td>Cleaning the driveway</td>
<td>50 gallons</td>
</tr>
</tbody>
</table>

Residential water usage accounts for 65 percent of all water used in Southern Nevada. Here are some examples:

<table>
<thead>
<tr>
<th>ACTIVITY</th>
<th>USAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Washing Machine</td>
<td>60 gallons (full cycle), per load</td>
</tr>
<tr>
<td>Dishwasher</td>
<td>30 gallons (full cycle)</td>
</tr>
<tr>
<td>Shower</td>
<td>5 - 8 gallons per minute</td>
</tr>
<tr>
<td>Tub bath</td>
<td>36 gallons full</td>
</tr>
<tr>
<td>Brushing Teeth</td>
<td>5 gallons per minute</td>
</tr>
<tr>
<td>Shaving</td>
<td>5 gallons per minute</td>
</tr>
<tr>
<td>Washing Hands</td>
<td>5 gallons per minute</td>
</tr>
<tr>
<td>Kitchen Sink</td>
<td>2 - 5 gallons per minute</td>
</tr>
<tr>
<td>Toilet</td>
<td>5 gallons per flush</td>
</tr>
<tr>
<td>Leaky faucet</td>
<td>50 - 1100 gallons per day</td>
</tr>
</tbody>
</table>

**JUST HOW MUCH IS ONE PER BILLION?**

- The world population is about 5 billion. Next time you’re walking about, say hi to five people. That’s 1 ppb.
- Let’s say you won $10 million and upon counting the total you realized you were 1¢ short. That’s 1 ppb.
- If you are 32 years old, you’ve lived 1 billion seconds. Close your eyes for 1 second. That’s 1 ppb.
Nearly all of the water in Southern Nevada is treated at the Alfred Meritt Smith Water Treatment Facility. As the water arrives through the intake pipe, it is treated with chlorine to kill potentially harmful bacteria and microscopic organisms. After disinfection, the water moves through a direct filtration process to remove harmful particles. Before the water leaves the treatment facility, it is disinfected again and treated for corrosion control. Water drawn from Southern Nevada’s deep ground water wells is treated with chlorine and sent through the distribution system.

</tbody>
</table>

(i) The actual NML for beta particles is 4 mm/L/year. EPA considers 50 pCi/L to be the level of concern for beta particles.

(ii) Action level: 97% of samples taken must be below this amount; 0% samples exceeded action level.

The SNWS tests for more than 100 substances. Only those substances on the EPA’s Primary Contaminants List that are detected in the SNWS’s drinking water are listed above.

**Unregulated Contaminants**

<table>
<thead>
<tr>
<th>SUBSTANCE</th>
<th>MINIMUM</th>
<th>MAXIMUM</th>
<th>AVERAGE</th>
<th>UNITS</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Choral Hydrates</td>
<td>0.7</td>
<td>1.3</td>
<td>1.2</td>
<td>ppm</td>
</tr>
<tr>
<td>Total Haloacetic Acids</td>
<td>1</td>
<td>35</td>

</tr>
<tr>
<td>Sulfate</td>
<td>74.8</td>
<td>232</td>
<td>201</td>
<td>ppm</td>
</tr>
</tbody>
</table>

All of the listed unregulated contaminants except sulfate occur as a result of the disinfection process. At present, the Environmental Protection Agency (EPA) does not consider these contaminants to be a public health concern. The EPA is monitoring these contaminants to determine if future regulations may be required.

* = Test results from Alfred Meritt Smith Treatment Plant
The City of North Las Vegas is located in Clark County in Southern Nevada. The city stretches across the northern rim of the Las Vegas Valley encompassing more than 78 square miles. North Las Vegas grew 142% from 1990 to 2000, earning it the designation as the 5th fastest growing large city in America. Since 2000, North Las Vegas' population has grown another 16% and the current population is 134,713 (January 2002). This makes North Las Vegas the fourth largest city in Nevada. Approximately 1,000 new residents move to North Las Vegas each month. The city estimates that its build out population (in approximately 20 years) will be 480,000. North Las Vegas celebrates its diversity and is living up to its motto of being "Your Community of Choice."

The vitality of the Las Vegas Valley has situated North Las Vegas as one of the burgeoning premier communities in the country. In 2001, the Bureau of Land Management released 1905 acres for sale to the public and two nationally-recognized developers (Del Webb and American Nevada Corporation) joined forces, calling themselves North Valley Enterprises, LLC, and purchased the property at a record $47.2 million. The resulting development agreement between North Valley Enterprises and the City of North Las Vegas will result in a premier master planned community, complete with parks, trails, a public golf course, and a variety of housing options.

The City’s focus on economic development has attracted numerous businesses to its already successful commercial and industrial business base. The City’s industrial market enjoys the lowest vacancy rate in Southern Nevada, despite the tremendous growth in available space. From 1998 to 2000, the construction of industrial and commercial space grew by 80%.

The economic development efforts are currently focused on attracting leading-edge technology businesses to North Las Vegas. With these priorities and the population surge in North Las Vegas, new businesses flourish daily.

North Las Vegas offers the finest in quality of life amenities. At an elevation of 1,940 feet above sea level, the Las Vegas Valley enjoys an average daily temperature of 80.7 degrees, with humidity in the mid 20's, and an average monthly rainfall of .34 inches. Making the climate ideal for enjoying the parks and trails within our community. As of January 2002, North Las Vegas has 23 parks with a total of 345 acres. This includes the neighborhood and community parks, school/joint use parks, special areas that include a sports complex, a historical site, a golf course, a regional park, and a linear park along a drainage area, as well as two full-service recreation centers.

The City's priority to provide quality recreational facilities will continue as the City grows. The 1,900 Acre Development by North Valley Enterprises, LLC will have more than 400 additional acres of parks and open space including trail systems. North Las Vegas is also situated near recreational facilities such as the Las Vegas Motor Speedway, the Lake Mead National Recreation Area, Hoover Dam, Red Rock Canyon Conservation Area, and The Valley of Fire. In addition, snow skiing, hiking, and camping are available on Mt. Charleston in the nearby Toiyabe National Forest.
